**STUDENT GUIDE:**

Instructors design exams to test whether or not you've learned the material, which they think is important, and which you should have learned by the time you finish the course. This may seem obvious, but there's an important point here. Tests are designed, and their design is very intentional. This means that if you identify the material that instructors feel is important and make good, educated guesses about how they will assess it, you'll never be surprised by a well-designed test. If you're not surprised by the test questions and have studied the material, chances are you'll be successful. So how do you identify important material and make educated guesses about test questions? The simple answer is that you try to think like your instructor. While this may seem difficult, instructors give you a lot of hints and clues during the course, starting with the course outline and continuing through your textbook readings and lectures.

**University Exams**

New students often find university exams to be rather different from the sorts of exams they've encountered previously.

University exam questions often require you to:

- go beyond material that was covered explicitly in the textbook and lecture
- think about the relationships between key concepts and ideas
- link together material from the text with material from the lecture and to think about the relationship of one to the other
- cover multiple pieces of information at once to test your knowledge of course material
- apply the theoretical concepts covered in the text and lecture to new situations

Instructors want to ensure that you've learned more than just the facts. They want you to understand the relationships between facts and to be able to demonstrate in exams how those facts and relationships integrate with other content. Pay close attention to examples, scenarios and stories in lectures and texts because often these are meant to highlight or emphasize important relationships and concepts.

**Advice:**

- Pay close attention to any examples or sample questions raised in lectures, because chances are your instructor is raising them for a good reason.
- Practise doing questions similar to the examples or sample questions, because it's likely the concept or connection is important and will show up on the exam.
- Don't just redo the examples you were given in class.
- Try creating concept maps to emphasize relationships.
- With classmates formulate sample test questions that apply the class material to new scenarios.
On Test Day

On test day, you may find the following tips helpful.

- Wake up early, but ensure you try to get a good night’s sleep.
- Most students have some degree of test anxiety. This is normal regardless of how much you have studied. Anxiety may be lessened if you did some good studying and feel prepared.
- Consult your list of equipment needed for the test such as pens, pencils, calculators, and equations. Take all that is required with you the day of the test.
  - Often during an exam students have to leave their backpacks in another spot, so ensure your equipment is in a clear plastic bag or can be easily carried to your seat.
  - Bring a water bottle with you so you can keep hydrated during the exam.
- Dress comfortably for the exam. Wearing layers helps you to deal with temperature variations.
- Try to get to class/exam area a few minutes early so you can get settled into your seat and do a few relaxation techniques (such a taking a few deep breaths).
- If you have students around you who are panicking and talking about the test, keep some distance and simply walk around a bit to help clear your mind.
- Turn off your cell phone and any other electronic items that will disturb others.
- A cool, calm and collected head is the biggest asset you can draw on while writing an exam. You can think your way through difficult questions and also avoid the costly little mistakes we all make when we rush through a test.
  - Breathe in and out slowly.
  - Think positive thoughts.
  - Focus on the test and not the students around you.
Test Taking Strategies

Look Over Entire Test

- Once you receive the test, the single most important thing you need to do is carefully listen to the instructor’s verbal directions.
- Thoroughly read all the test instructions.
- Before you begin responding to the questions, write down important formulas, processes and keywords in a margin so you don’t have to worry about forgetting them when you get to the questions (this is often called a ‘brain dump’).
- Skim through the entire test first.
- Some tests have multiple parts, some with optional and mandatory questions, and you want to make sure you completely understand what you need to accomplish before you jump into answering the questions.
- Answers to some questions are often contained in others. Each question includes information which may help you answer other questions. The easiest way to take advantage of this is to skim through the test first and see where potential information may be.

Create a Time Budget

- At any given point during an exam, you should know the maximum number of minutes you have to spend on the current question or section before moving onto the next. Set strict time limits on each question to prevent you from running out of time.
- Build a time budget by taking the time allotted for the exam and subtracting 10 minutes. Next, divide this amount by the number of questions or sections. The result is how long you have to spend on each section.
  - You want a few extra minutes to double check your answers when you are finished or go back and add more insights to questions on which you were rushed.
  - For an exam with a small number of questions, mark right on the test pages the time when you should begin and finish each one. For an exam with many questions, divide the exam into roughly equal sections, then jot down the time you should begin and end each section. These recorded times should help you keep organized.
  - You can also divide the time available by the number of marks each question is worth. Only give each question the time it warrants and then move on to the next.
Proceed from Easy to Hard

- Most students do not answer an exam in the order the questions are given. Answer the easiest questions first or those questions that you immediately can answer.
- Don’t worry if you skip all over the exam; in most cases the order is irrelevant.
- Advantages:
  - Focuses your energy on the questions you know the most about, ensuring you get maximum points on these.
  - Gives you a better chance of getting through the more difficult questions.
  - Helps stimulate your mind and prepares you for answering the harder questions.
  - Reduces panic when you get to the harder questions.

Outline Essay Questions

- When you get to an essay question, do not just start writing and see what happens. This approach will lead to a very rambling answer that makes no sense! First, jot down a quick outline of what you think your answer will entail. It may seem like a waste of time, but 2 to 3 minutes doing this could result in a well-written answer.
- Read each question carefully.
  - Note and underline key words and concepts.
  - Pay special attention to the type of question (e.g., analyze, compare, or evaluate). Your response will vary based on the type of question.
- Use the margin of the exam to jot down all the points you can recall that are relevant to the question.
  - Record only a few words for each point to save time and space.
  - Write the words that come to your mind right away.
- Go back to the question and check the words that you underlined.
  - Make sure your points adequately address the question.
  - Number these points in the order that you want to present them. This will help with a quick organization of the essay.
- Begin writing your essay.
- Pay attention to the time limits to ensure you have enough time to write about each point.
- Go back and re-read the essay checking for clear writing and proper spelling and grammar.

Check Your Work

- If you have extra time at the end of the exam, go back and check your work. You will be surprised how many times this final review turns up a mistake in a problem or an important concept that you forgot to mention in the essay.
- If you still have time after your first round of review is over, then go through and check again, perhaps checking from back to front. You may notice new mistakes.
- It’s tempting to relax after finishing your exam and to hand it in early in front of your peers, but this is not a good thing to do. Double and triple check your work - it will be worth it!
Multiple Choice Questions

Is there a formula?
Some students (and instructors) claim that there is a formula to create most multiple choice questions. This formula dictates that there is:

- one answer which is obviously wrong
- one which is tricky and included simply to trap you if you misread the question
- two which are very similar, one of which is the correct one, and ... 
- often an 'All of the above' or 'None of the above' thrown in to make a total of five.

While this may be true in some circumstances, it's certainly not true everywhere. Making this sort of assumption is likely to lead to mistakes and wrong answers. Likewise, 'When in doubt, pick C' may be a comforting rule, but your instructors have heard this rule too, and many will try to distribute correct answers fairly equally among all choices. So, if you have to guess the answer to a particular question, put your trust in your own knowledge and reason, not in some magic formula or rule, and make a truly educated guess.

Systematic Approach
Multiple choice questions come in various formats from straight definitions to analogies to problem solving. Among a selection of responses, there’s one correct (best/true) answer, and it’s your job to find it! Careless mistakes are often made when students rush through the "stem," or first part of the question, and miss important information. Try this approach to make sure you read each question thoroughly.

1. Cover up the answers before you read the question (called the stem).
2. Read the stem carefully, perhaps several times.
3. Process the stem:
   - Underline key words with your pencil/pen
   - Translate the question into your own words
4. Predict an answer.
5. Uncover the alternatives and read all of them carefully, even if the first choice seems correct.
   - Watch for small but important words, called modifiers such as always, only, most, all, never, completely, best, worst, smallest, largest etc. which may help in answering the question
   - Be wary of ‘multiple response’ answers “All of the Above”, “None of the Above” or some combination of choices. You’ll need to treat each of these responses as true/false situations and answer accordingly.
   - In general, don’t choose responses that include words you don’t know or never have seen.
6. Identify the best response.

This is just one approach, but it is a good way to systematically work through multiple choice questions, especially when an entire exam may be composed of them!
Difficult Questions

If you've followed the steps in the previous section and you're still not sure of an answer, it's tempting to keep re-reading and re-working the question until you select one. The language of multiple choice questions can sometimes lead to confusion about what the question is really asking. However, you may be wasting valuable time as you "worry through" these questions.

If you're unsure of an answer, you have 2 choices:

1. **Skip the question and come back to it later**
   - or –

2. **Attempt to decode the question with a bit more detail**
   
   Trying the following techniques may help:
   
   - Pay attention to absolute terms, such as 'never', 'always' or 'none'. They often (but not always) indicate that the statement is false.
   - Pay attention to the use of negatives, such as 'not', 'unless' or 'none'.
   - Look for information that might distract you from the real purpose of the question.
   - Rephrase a stem in your own words; for example, try changing a question to a statement. Be careful, however, not to lose sight of the original meaning of the stem.
   - Treat each alternative as a true-false statement, and search for the one true statement amid the answers.
   - If you're debating between two similar answers, try identifying which is the worse answer, rather than which is the better one.
   - If you have run out of time, if you still don't know the answer, and if there is no penalty for wrong answers - guess.

In general, when reviewing answers, you should only change an answer if you have a specific reason for doing so (for example, you remembered a new piece of information). Even if you're not entirely sure that your answer is correct, it's usually better to keep it than to switch to another answer at the last minute.

Keep in mind that these techniques will not work for all questions, and that they can be time-consuming. If some of these techniques seem helpful, make sure you familiarize yourself with them in a practice exam well before the midterm or exam.
**COURSE OUTLINE TOP TEN TAKEAWAYS**

1. University exams often require you to go beyond material covered in the lectures and textbook and cause you to think about relationships between many concepts.
2. Get enough sleep, have all your materials ready, dress comfortably, avoid panicky students, and try to stay calm on test day.
3. Look over the entire test first to give you an idea of what types of questions you will be answering.
4. Write down any formulas, processes, and keywords in the margins as soon as you get the test.
5. Create a time budget by taking the total time you have and dividing it up by sections or questions.
6. Start with easy questions and then work on the harder ones.
7. For essay questions, ensure you take a few minutes to plan out what you are going to write.
8. Spend 10 minutes proofreading the exam at the end.
9. Multiple choice questions are not devised with a specific formula every time. Don’t fall into the trap of ‘picking C when in doubt’ or other rules of thumb. You need to read each choice and pick the correct answer.
10. For multiple choice questions, try covering up the choices before reading the question. Predict your own answer before you read the choices.

**PRACTICE ACTIVITY:**

The purpose of this activity is to practice your test taking skills by writing a multiple choice quiz. The quiz will test your understanding of the psychology content from the textbook reading and the lecture in the previous sections.

The quiz has 10 questions and is intended to be 7 minutes long. A ratio of 1.5 questions per minute is often used for multiple choice exams. Try to stick to the time limit as it is important to see how far you can get in the time allowed. If you do not finish in the time allowed, make a note of how far you got, and then try to finish the rest of the test. This will give you a chance to try every question.

**Instructions:**

1. Have a piece of paper in front of you so that you can record your answers.
2. Have a clock nearby so that you can determine when your 7 minutes for the quiz starts & ends.
3. Using your understanding of the Psychology content read and answer each question. Try to apply the test taking strategies discussed in the guide.
4. A tip is provided below each question to provide suggestions on things to look for when determining the correct answer.
5. When you are finished the quiz, go to the Answers section, located directly below the quiz to determine your score out of 10.
Sample Quiz

1. Which of the following is incorrect?
   A) The range of a data set is never equal to the variance of the set
   B) Standard deviation is the average of the squared deviations from the mean
   C) The variance of a data set is never equal to the standard deviation
   D) Range and standard deviation are both useful pieces of information
   E) None of the above

   Tip:
   The important word in this question is ‘incorrect’. Read each choice one at a time. Consider if
   the choice is true or false. The word ‘never’ appears in two of the statements (a and c). ‘Never’
   is a word that may help you in determining if the choice is true or false.

2. Which of the following is not a descriptive statistic?
   A) The median height of any ten of your classmates
   B) The mean IQ of all Canadian males
   C) The mode weight of half the shipping traffic in the Suez Canal
   D) The standard deviation of the heights of any ten of your classmates
   E) The mean time it took 73 people to finish the Boston Marathon

   Tip:
   The important word in this question is “not”. Underline this word on a test. There are 5 possible
   choices and all are roughly equal in length and plausible. Read each statement and determine if
   it is true or false. Another thing to remember is that you are looking for statements that could
   be termed ‘a descriptive statistic’ - look for a situation that would be used for this term.
3. The standard deviation of a normal distribution is always equal to:
   A) The average of the squared deviations from the mode
   B) The difference between Z scores of 1 and –1
   C) The median score minus Z at –1
   D) Both A and B
   E) Both A and C

   Tip:
   This is a question that has 3 written choices and 2 choices that are a combination of the first three. The question is a completion statement that has two key words “always equal”. Read each choice one at a time and consider if it would be “always equal” to the standard deviation of the normal distribution. If you find only 1 of the first three choices could be possible, then you can rule out d) and e). If you find 2 of the first three choices to be possible, consider d) and e) as other possible answers.

4. In a normal distribution:
   A) The mean is equal to the mode
   B) The mode is equal to the median
   C) 68% of scores fall within 1 standard deviation of the mode
   D) Both A and B
   E) All of the above

   Tip:
   This question just begins with the words “In a normal distribution:” and it assumes that you are completing the sentence with the most correct answer. There are three choices, one combination choice and one ‘all of the above’ choice. You need to treat each choice as a true and false statement. If you immediately know that choice “a” is correct then you need to move onto b and c and consider if they too are correct. Choice “c” will really need your consideration for being true or false as it will allow you to ignore or consider choices “d” and “e”.
5. If we know the standard deviation of a normal distribution, we can:
   A) Determine the mean
   B) Determine the mode
   C) Determine the median
   D) Describe the variability of the distribution
   E) All of the above

   Tip:
   This question is asking about the relationship between the standard deviation of a normal distribution and mean, mode, median and variability. Think back to what you've learned about these concepts, and treat each question as a true or false statement to rule out each choice. If more than one choice seems correct, then consider the final choice (E - All of the above), but don’t jump to that before considering the individual choices.

6. Z scores:
   A) Divide a normal distribution into equal-sized pieces
   B) Are equal to the standard deviation of a data set
   C) Are equally spaced on a normal distribution
   D) Both A and C
   E) All of the above

   Tip:
   This question just begins with the words ‘Z scores’ and therefore you must consider the answers as a completion of these two words. Note that the first three choices all have the word "equal" in them but use the word differently each time (e.g., equal-sized, equal, equally spaced). Concentrate on the use of the word "equal" to decide which statement (or a combo of two or all of them) will correctly complete the sentence.
7. The normal curve:
   A) Is always bell-shaped
   B) Has a variance equal to the square of Z at 1
   C) Is symmetrical about Z at 0 (zero)
   D) Both A and C
   E) All of the above

Tip:
This question is a statement that needs the sentence completed with the most correct answer. Treat each statement as a true or false answer. If you are positive more than one statement is correct, then you need to consider the last two choices. The only way to rule out the last two choices (both a and c; all of the above) is to clearly ensure that there is only one correct answer from a, b or c. Read each statement separately.

8. In a normal distribution:
   A) The top 4% of all scores fall above Z at 2
   B) The lowest 16% of all scores fall below Z at -1
   C) The middle 66% of all scores fall between Z at 1 and Z at -1
   D) All of the above
   E) None of the above

Tip:
This question really calls upon your understanding of the normal curve and the distribution of scores. It might be best to draw a little picture of the normal curve and label the percentage of scores that fall in each standard deviation. Label Z on the normal curve too. When you have this little drawing, the answer to the question should be much clearer and will allow you to read each statement with a reference diagram.
9. A vertical line drawn down the middle of a normal curve:
   A) Represents Z at 0 (zero)
   B) Represents the median frequency
   C) Divides the scores into two equally-sized groups
   D) Both A and B
   E) Both A and C

Tip:
This is a question that requires a small normal curve distribution diagram to help you understand the three choices presented to you. You only have to rule out three possible answers. If you label the normal curve with all the proper titles and distribution of standard deviations, the diagram will help you determine the correct answer.

Given a test on which the scores were normally distributed, where 98% of the class passed, more people received a score of 72% than any other score, and a passing score was 50%, answer the following question:

10. The average score on the test was:
   A) 50%
   B) 63%
   C) 76%
   D) None of the above
   E) Not enough information

Tip:
This question requires some work on your part. There is a little paragraph of information (a scenario) given to you before the question is asked. Read the scenario and underline the important information. Be aware that extra information might be presented to throw you off or be used for other questions later on the test. You may need to draw a diagram and/or do some calculations with the content you have studied.
Quiz Answers:
1. B
2. B
3. C
4. E
5. D
6. C
7. D
8. B
9. E
10. D
